ISTANBUL SEHIR UNIVERSITY

CS361 Assignment 1

Due Date
November 24, 2016

DJANGO VIEWS

In this assignment, you are expected to create a simple blog, based on the ToDo app written in the practice session.
For example:
The url "localhost:8000/blog/entries", will show all the blog entries.
The url "localhost:8000/blog/entries/2" will show the third blog entry.

Note: There is one caveat to that: blog entries has entry header and entry body. So you will need to structure your data accordingly.

In order to do this assignment you should make some changes on templates, urls, views and models. You should also have "todo" app working in your project. Todo app is provided with the zip file, so you do not have to write it.

You should create README.md file into the project root and write the url of your project's github page into it. Afterwards, you should add the project and commit as "software assignment 1". Then push all the code into your github account.

In the end you should change your project name with your name_surname then zip it and submit before due date.

Note: You have to submit your code before due date, otherwise your project would not be accepted(even if it is pushed to GitHub).
